Tandem Workshop on Optimality in Language and Geometric Approaches to Cognition

13 December 2010

Anton Benz Alexandra Strekalova ZAS Berlin Conceptual spaces for matching and representing preferences

< ロ > < 同 > < 回 > < 回 > < □ > <

- **Overall goal**: Develop Non-Player Characters (NPCs) with natural language dialogue capabilities.
- Our scenario: furniture sales agent
- Funded by Investitionsbank Berlin (IBB) by the ProFIT Programme.
- Partners: German Research Centre for Artificial Intelligence (DFKI) and Centre for General Linguistics (ZAS).
- In cooperation with Random Labs and Metaversum GmbH.

- 4 同 6 4 日 6 4 日 6

## That's how it looks

Anton Benz Alexandra Strekalova ZAS Berlin

Conceptual spaces for matching and representing preferences

# Modeling a dialogue situation and an NPC response

- User gives some preferences about a furniture object that he would like to have.
- NPC has to respond by:
  - showing an object that fulfills these preferences, if he can find one.
  - suggesting alternative object properties, if the database does not contain such an object.

**User**: I would like to have a *purple leather* sofa. **Agent**: I'm afraid we don't have a purple leather sofa, but I can show you a *purple fabric* sofa or *black leather* one.

# Preference modelling: Deontic Logic

I would like to have a purple leather sofa.

• Modal logic:

 $\mathbf{D} \exists x (have(I, x) \land sofa(x) \land purple(x) \land leather(x))$ 

Ross's paradox:

- I want that the letter is mailed.
- I want that the letter is mailed or burned.

$$\mathbf{D}\varphi \Rightarrow \mathbf{D}(\varphi \lor \psi).$$

- 4 同 6 4 日 6 4 日 6

## Alternative: Multi-Attribute Utility Analysis

I would like to have a purple leather sofa.

- Representation as Constraints:
  - $C_1 = \langle \text{color, purple} \rangle$  soft
  - $C_2 = \langle material, leather \rangle$  soft
  - $C_2 = \langle ObjType, sofa \rangle$  hard
- Decompose utility function of customer:
  - F: global utility function over objects of given type;
  - *F*<sub>colour</sub>: preference over colours;
  - F<sub>material</sub>: preference over materials;

$$F(o) = F_{colour}(o) + F_{material}(o), \ o \in ObjType.$$

- ( 同 ) ( 回 ) ( 回 ) - 回

I would like to have a purple leather sofa.

- (X, D, C, F): Cost network
- $X = \{ object, color, material, style \}$
- $D_{color} = \{Auburn, Chocolate, Mahogany, ... \}$
- $D_{material} = \{ fabric, leather, plastic, ... \}$
- *o*: objects = instantiation of variables
- C = <ObjType, sofa>: hard constraint
- $F_{global} = \alpha_{colour} F_{colour} + \alpha_{material} F_{material}$

# Constraint optimization

Task: To find an optimal suggestion by minimizing the global cost function:

$$min_o F(o) = min_o \sum_{i=1}^n \alpha_i F_i(o).$$
 (1)

- Problem: Values for the weights α<sub>i</sub> and functions F<sub>i</sub> are unknown!
- Expressed preferences only set the goal.
  - Functions *F<sub>i</sub>* can be constrained only very broadly;
  - Weights  $\alpha_i > 0$  can have arbitrary values.
- Approach: Use natural similarity measure on the domains (*Conceptual Spaces*) to constrain *F<sub>i</sub>*.

I would like to have a purple leather sofa.

- Purple leather sofa defines a point in a conceptual space
- This conceptual space is a product of color and material spaces
  - Color space is defined by HSV color model (hue, saturation, value)
  - Material space is defined by material properties (organic, robust, rough, ...)
- Problem: the color space is too fine grained
- Solution: define equivalence classes of properties which have a similar distance from the desired goal property.

# Equivalence classes

- Divide all property values into *n* equivalence classes according to the distance to the desired property value.
- How can we assign equivalence classes?

伺 と く ヨ と く ヨ と

# Equivalence classes

- Divide all property values into *n* equivalence classes according to the distance to the desired property value.
- How can we assign equivalence classes?

#### Color = (hue, saturation, value)

- Compute distance between the desired color and the color of the current object.
- Compare the value with a threshold and assign an equivalence class.

(人間) ト く ヨ ト く ヨ ト

# Equivalence classes

- Divide all property values into *n* equivalence classes according to the distance to the desired property value.
- How can we assign equivalence classes?

#### Color = (hue, saturation, value)

- Compute distance between the desired color and the color of the current object.
- Compare the value with a threshold and assign an equivalence class.

#### Material = (organic, robust, rough, ...)

- Count the number of overlapping boolean values for material properties for the desired material and the material of the current object.
- Compare the number with a threshold and assign an equivalence class.

#### Theorem

Let  $(E_i)_{i=1}^n$  be a sequence of sets of natural numbers, and  $E = \prod_{i=1}^n E_i$ . Let  $e = (e_i)_{i=1}^n \in E$ . Then the following conditions are equivalent:

1. There are weights  $\alpha_i$  and functions  $F_i$ :  $E_i \to \mathbb{R}_0^+$ , i = 1..., n, such that

i. 
$$\forall i : \alpha_i > 0$$
,  
ii.  $\forall n, m \in E_i : n < m \rightarrow F_i(n) < F_i(m)$ ,  
iii. and

$$F(e) = \min_{e=(e_i)_{i=1,\ldots,n}} \sum_{i=1}^n \alpha_i F_i(e_i)$$

2. e is an element of the set

$$K = \{ e \in E | \forall e' \in E : \exists i \; e'_i < e_i \rightarrow \exists j : \; e_j < e'_j \}.$$

## Candidate set

• Determine the candidate set K (vectors of equivalence classes), such that for each  $e \in K$  there are weights  $(\alpha_i)_{i=1,...,n}$  and functions  $(F_i)_{i=1,...,n}$  and for which holds:

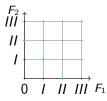

$$F(e) = \min_{e=(e_i)_{i=1,\dots,n}} \sum_{i=1}^{n} \alpha_i F_i(e_i)$$
(2)

## Candidate set

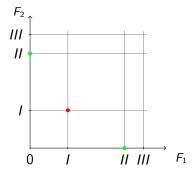

Determine the candidate set K (vectors of equivalence classes), such that for each e ∈ K there are weights (α<sub>i</sub>)<sub>i=1,...,n</sub> and functions (F<sub>i</sub>)<sub>i=1,...,n</sub> and for which holds:

$$F(e) = \min_{e=(e_i)_{i=1,\dots,n}} \sum_{i=1}^n \alpha_i F_i(e_i)$$

### • Task:

- Find alternative values for preferences expressed by user
- Generate an adequate answer
- Approach:
  - Represent preferences as hard and soft constraints
  - Minimize functions for value parameters in a cost network
  - Exploit the geometric structure of property spaces
  - Generate an answer which offers the closest satisfiable property combination
